AskAgent Protocol

Your agent talks to
the website’s agent.

The website’s own expert, reachable through a link.

How agents access a website

Entry point	What the agent receives	Who interprets the site
llms.txt	Site context, instructions and links	The visiting agent
Browser UI	Pages and controls made for people	The visiting agent
AskAgent	A site-specific answer and links to continue	The website’s agent

AskAgent puts site-specific reasoning on the website.

The website’s own expert agent

The site supplies its own data and business rules.

Its agent applies that knowledge to the visitor’s actual request.

Prepared for this website.

The conversation starts with a link

/askagent

Ordinary HTTP.
No MCP or connector setup.

01 **Discover**
The site describes its capabilities.

02 **Ask**
A question reaches the site’s own agent.

03 **Continue**
Follow-up links preserve the conversation.

04 **Handoff**
The site returns a link into its workflow.

The answer carries the next step

The website returns enough context to continue the task.

Answer	What the site can fulfil under the user’s constraints.
Evidence	Source facts and a current quote when relevant.
Next links	Complete links for follow-up or a supported next action.
Context	The same request context carries into the handoff.

Human confirmation stays on the website.

Prototype: three independent site agents

25 red roses to Kadikoy by 20:00.
Under 1,500 TRY including delivery.

Rose & Stem	Exact match
Petal Atelier	Cannot meet the request
Tulip House	Pink roses need approval

Exact match

1,370 TRY

Including delivery
Today by 19:30

Fictional demo data. Fixed scenario clock. Checkout is simulated.

AskAgent Protocol

A website’s expertise.
A direct conversation.
